Reading
Please read/review chapter 9 of Robotics, Vision and Control.

Questions

1. Write the full equation of motion for the 2R arm above (i.e., $\tau_1$ and $\tau_2$ as a function of $\theta_1$ and $\theta_2$ and its derivatives)
Challenge Question:
2. Inverse Kinematics & Trajectory Generation
   A small humanoid robot is being programmed to place a hat on its head. The objective is to place the hat in the position shown by the dashed outline in the figure below. Assume that the arm is composed of 3 revolute joints and is constrained to move in the plane of the page. The arm consists of 3 links with dimensions: \( L_1 = 0.4 \), \( L_2 = 0.3 \), \( L_3 = 0.1 \).

In order to place the hat on its head, assume that we must place the edge of the hat brim at a location 0.5m above its shoulder joint. The hat brim should be in a horizontal position and is gripped at its edge by the hand and is aligned with the last link of the arm. Please calculate/plot valid workspace (e.g., from the frame located at the right-most end of the brim where the robot is grasping it) and joint trajectories to place the hat correctly.
